STIC-Biotech/ChemLib U.S. Serial No. 09/669,187

Aloha!

Please search **SEQ ID NOS.: 73, 80, 81, 148, and 906** from U.S. Serial No. **09/669,187** v. all relevant databases, including interference. Please limit search results to oligonucleotides less than 50 nt in length, if possible. Place results on both paper and electronic format (i.e., disk, e-mail, etc.). Thanks!

Jeffrey S. Parkin, Ph.D. Primary Examiner Art Unit 1648 REM 3D39 2-0908

3C/8

The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidated to py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, baemophilus, campylobaccer, clostridium, Bscherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                              Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour, viral infection, bacterial infection; fungal infection; parasitic infection, cancer; asthma, infectious disease; allergy, immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Angiogenesis inhibitor; 88; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia;

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contect dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                   Treating non-allergic inflammatory diseases, such as psoriasis, eczeallergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ds, allergy, asthma, poly-G nucleic acid, aerosol formulation, hypo-responsive subject, immunostimulatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 20 BP; 0 A; 0 C; 8 G; 12 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     administering at least one antitangle mortaic acid molecule. Also included is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasis, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunostimulatory; antiinflammatory; dermatological; antipsoriatic; antiulcer; gene therapy; vaccine; non-allergic inflammatory disease; psoriasis; eczema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; crohn's disease; ss.

New immunostimulatory oligonuclectide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g. melanoma

Example 17; Page 80; 139pp; English.

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA coligonucleotides (without a CPG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendric cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipides. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the invention.

Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to method for determining neoplastic state of a cell, involves detecting the presence of plasma membrane nucleotide in the cell or quantifying the amount of plasma membrane nucleolin in the cell. The invention is useful for diagnosing pre-malignant cells, malignant cells and lung small cell carcinoma. The present sequence is a non-antisense oligonucleotide

The invention relates to a novel quantitative method for adding linear polynucleotide to solution containing a cation. The linear polynucleotide contains telomere repeat sequence with donor at one edge portion and acceptor at another edge portion. The optical detection is performed using this linear polynucleotide. The method of the invention is useful in medical fields such as clinical laboratory test and fields with cation fixed assay. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting apoptosis comprises preparing a sample from which cells have been removed and detecting at least one of nucleolin and PARP-I in the
                                                                                                                                                                                                                         Quantitative method of cation for clinical laboratory test, involves adding linear polynucleotide containing telomere repeat sequence with donor and acceptor at edge portions, to solution containing cation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Guanosine-rich oligonucleotide GRO J, used in apoptosis detection.

The present sequence is that of guanosine-rich oligomucleotide GRO J, which can be used in the method of the invention. The method is for the detection of apoptosis. It involves preparing a sample from which cells have been removed, and detecting nucleolin and/or poly(ADP-ribose) polymerase (PARP-1) in the sample, where the sample is blood, serum, plasma, tissue, tissue culture medium or sputum. Detection of nucleolin involves detection of a complex between nucleolin and a nucleolin binding molecule, preferably an anti-nucleolin antibody or a GRO, such as GRO J, which is characterised as a good plasma membrane nucleolin-binding GRO. The method allows detection of excessive apoptosis in a subject suspected of having AIDS, a neurodegnerative disease, an ischaemic injury, an
                                                                                                                                                                                                                                                                                                                                                            autoimmune disease, a tumour, a cancer (especially endocervical adenocarcinoma, prostatic carcinoma, breast cancer, leukaemia and nonsmall cell lung carcinoma), a viral infection, an acute inflammatory condition or sepsis (all claimed).

Treating cancer in a subject comprises administering to the subject a therapeutically effective amount of an anti-nucleolin agent and a Disclosure, SEQ ID NO 28; 32pp; English. carrier.

The invention relates to treating cancer in a subject comprises administering to the subject a therapeutically effective amount of an anti-nucleolin agent and a carrier. Also included is a pharmaceutical composition comprising a nucleolin antibody or an inhibitory RNA against nucleolin, and a carrier. The method and antibodies, RNA and composition are useful for treating cancer, such as melanoma, lymphoma, plasmocytoma, sarcoma, glioma, thymoma, leukemia, hepatoma, or breast, prostate, colon, RESULT 10

This invention relates to a novel method for treating inflammation in a patient which comprises administering to the patient a composition comprising a GRO (guanosine-rich oligonucleotide). The invention may be useful for the development of compounds with an antinflammatory.

C analgesic, gynecological, hepatotropic, neuroprotective, nootropic, antisterintic, antistemmatic, gastrointestinal-Gen. or antiulorer activity whilst the disclosed sequence may prove useful for gene therapy. The methods are useful for treating inflammation associated with an acute inflammatory condition. The acute inflammatory condition is selected from primary dysmenorrhea, acute alcoholic liver disease and acute from particles. The inflammation may also be of Alzheimer's disease or associated with a chronic inflammacory disease. The chronic inflammatory disease is selected from rheumatoid arthritis, asthma, gastrointestinal crack disease, psoriasis, atherosclerosis, Crohns disease, ulcerative clisease, psoriasis, atherosclerosis, Crohns disease, ulcerative clisease, psoriasis, atherosclerosis, Crohns disease, ulcerative clisease is elected GRO J which was used during the development of the order method of the invention.
                                                                                                                                                               ö
liver, esophageal, brain, lung, ovary, or cervical cancer. The present sequence is a GRO (guanine-rich oligonucleotide) which binds to nucleolin (thereby inhibiting cancer cell growth).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ø

The folding of telomeric DNA into G-quadruplexes inhibits telomerase, the enzyme present in over 8% of tumor cells which adds nuclectides to telomeres, preventing them from reducing in length during cell division. The carbazole compounds of the invention may be used to treat telomereral addiesase, e.g., cancer. Sequences ADZ25610-ADZ25619 represent DNA sequences capable of duplex or quadruplex formation which were demonstrated to be bound by a carbazole compound of the invention. The present sequence represents a G-quadruplex-formation which were bound by a carbazole compound. Note: The specification states that this sequence forms a G-quadruplex structure; however, further details on how
                                                                                                                                                                                                                                                                                                                                                                    Telomere; stabilizer; telomerase inhibitor; cancer; neoplasm; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New carbazole compound stabilizing G-quadruplex of telomere, useful to treat telomerase-related disease e.g. cancer.

method has been developed for binding quadruplex nucleic acids. The method comprises contacting a quadruplex nucleic acid with a monoclonal antibody that selectively binds to quadruplex nucleic acid to form an antibody-quadruplex nucleic acid complex. The method can be used for detecting antibodies that bind to quadruplex nucleic acids and to collect attibodies that bind to quadruplex nucleic acids and to collect cartibodies that bind to quadruplex nucleic acids and to collect suitable for detecting, isolating and purifying quadruplex nucleic acids. The method is also suspected of containing quadruplex nucleic acids. The method can be used for the purification of quadruplex nucleic acids from solutions and to suspected of containing quadruplex nucleic acids from solutions and to purify aptamers from combinatorial libraries or heterogenous solutions, in particular to purify or detect DNA aptamers that specifically bind the thrombin molecule critical in the thrombin-catalysed, fibrin-clot cormation cascade of blood platelets. The antibodies can then be used to detect levels of a known therapeutic aptamer in a patient and monitor clearance and dosage levels in a treatment protocol involving the aptamer. The present sequence trepresents an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Quadruplex nucleic acid and antibody binding assay useful for detecting and purifying antibodies and nucleic acids from a biological sample.

```
The present sequence represents a primer from the present invention which describes human telomerase reverse transcriptase (frRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hrRT, by detecting the change in hrRT cecombinant protein or polymucleoride, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of hrRT with a telomerase RNA component; (C) detection of hrRT with a sample by binding a relevant probe to the sample of hrRT RNA or protein in a sample by binding a relevant probe to the sample of maplifying the product and correlating the presence of complex or amplifying the product with presence of hrRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hrRT expression; and (B) the use of an agent that causes an increase in cell correlation to create a medicament that inhibits ageing. A protein preparation of hrRT and the polymucleotide encoding hrRT can be used in the manufacture of medicaments for inhibiting the cancer inhibitors of telomerase activity can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a guanine rich sequence derived from the Oxytricha telomeric region. This sequence forms an unusual structure termed a G quartet. The formation of this structure is monovalent cation dependant and is disrupted by high temperature. Sequences which share the guanine rich nature of this telomeric sequence may be used to inhibit human type II phospholipase A2 activity. Oligonucleotides such as these may also be used for inhibiting activity of HSV, HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant calls by modualting telomere length, which may also retard aging. (Updated on 25-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.

                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a primer from the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT cast compound is a modulator of hTRT, by detecting the change in hTRT cast combinant protein or polymucleotide, on administration of the compound; (B) preparation of hTRT with a telomerase by contacting a protein of the TRT with a telomerase BNA component; (C) detection of the TRT with a telomerase BNA component; (C) detection of the TRT with a telomerase BNA component; (C) detection of the TRT with a telomerase BNA component; (C) detection of the TRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT cast and (B) the use of an agent that causes an increasing hTRT cast send in the maniferance of medicament that inhibits ageing. A protein preparation of hTRT and the polymucleotide encoding the fact of ageing or cancer. Inhibitors of telomerase activity and be used to the maniferance of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity and the new methods protein preparation of hTRT can also be used in the new methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                       Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing.

The present sequence represents a primer from the present invention which describes human telomerase transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a teat compound is a modulator of hRRT, by detecting the change in hRRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein of the preparation of the compound; (C) detection of the hRRT with a telomerase RNA component; (C) detection of the hRRT with a relomerase RNA component; (C) detection of the hRRT with a telomerase RNA component; (C) detection of the hRRT with a product and correlating the presence of complex or amplifying the product and correlating the presence of hRRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hRRT cappearation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding correct conditions that are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
Human, telomerase reverse transcriptase, hTRT; TRT; diagnosis; prognosis; cell proliferation; cancer; ageing; ribonucleoprotein; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Harley CB;

The present sequence represents a primer from the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of hTRT with a telomerase by contacting a protein of the hTRT with a telomerase by contacting a protein of the hTRT with a telomerase RNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant probe to the sample amplifying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample, and (D) increasing the proliferation of a vertebrate cell by increasing hTRT camplification product with presence of an agent that causes an increasing hTRT carporate cell proliferation to create a medicament that inhibits of hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used to treat conditions that are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new methods

The present sequence represents a primer from the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (C) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase RNA component; (C) detection of the hTRT WNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of RNA detection, and detecting the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT and sequing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used to treat conditions that are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention relates to a method for detecting differential methylation patterns in an helicase-like transcription factor (HLTF, also called HIPILGA, 2D1, RUSHIA and Samarca) nucleotide sequence. The method involves obtaining samples from a patient and a healthy subject, assaying the samples for the presence of methylation within a nucleotide sequence and comparing the methylation patterns in the sample from the subject to those in the normal sample. HLTF modulator is useful for treating an HLTF-associated proliferative disease in a subject, where the disease is associated with methylation of an HLTF nucleic acid sequence, i.e. colon neoplasia and the compound induces HLTF expression. The method of the invention is useful in gene therapy. The present sequence is the human HLTF's unmethylated DNA fragment amplifying PCR primer.
                                                                                                                                                                                                                                                            Detecting differential methylation patterns in an HLTF nucleotide sequence, useful for diagnosing or treating colon neoplasia, comprises assay samples for the presence of methylation within a specific nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA methylation; HLTF; helicase-like transcription factor; HIP116a; RUSH1a; Smarca; proliferative disease; colon neoplasia; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human HLTF unmethylated DNA amplifying forward PCR primer, 1347UF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes the human SLC5A8 protein (1), which is a cell surface protein. (1) has cytostatic activity, and can be used in gene therapy. (1) can be used in detecting and treating SLC5A8-associated cancer. e.g. colon cancer, breast cancer, thyroid cancer or stomach cancer. (1) is also useful in screening assays, predictive medicine and in diagnostic and prognostic assays. The human SLC5A8 gene is located on chromosome 12. The present sequence is used in the exemplification of the

                                                                                                                                                                                                                                The present invention relates to a method for detecting differential methylation patterns in an helicase-like transcription factor (HITF, also called HIP116a, ZDu1, RUSHIa and Smarca) nucleotide sequence. The method involves obtaining samples from a patient and a healthy subject, assaying the samples for the presence of methylation within a nucleotide sequence and comparing the methylation patterns in the sample from the subject to those in the normal sample. HITF modulator is useful for treating an HITF associated proliferative disease in a subject, where the disease is associated with methylation of an HITF mucleic acid sequence, i.e. colon neoplasia and the compound induces HITF expression. The method of the invention is useful in gene thereby.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAT28317-T28347 represent multi-G oligonucleotides. AAT28336-T28347 are multi-G oligonucleotides with multiple G strings, or G strings of 4 bases and over. These sequences are oligonucleotides of the invention. These sequences can be modified to become more nuclease resistant, using phosphorothioate, phosphorodithioate, or 3'-carbon modified links. To
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Multi-G oligonucleotide; antisense sequence; c-myb; nuclease resistant; phosphorothioate linkage; phosphorodithioate linkage; inhibitor; therapy; cell proliferation; smooth muscle cell; proliferation protein; vascular restenosis; arterial restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New modified oligo:nucleotide(s) contg. consecutive guanine residues -inhibit proliferation of smooth muscle cells, esp. to prevent arterial restenosis.

screen for modified multi-G sequences that inhibit cell proliferation, cultured smooth muscle cells that are arrested in the GO phase, are induced to proliferate in the presence of the multi-G sequence. The cultured smooth muscle cells used in this method are attached to a solid support, and growth arrest is achieved on a starvation medium, followed by transfer to a normal growth medium to induce proliferation. The compounds that provide over 50% inhibition at a set dosage are selected as being useful for inhibiting vascular restenosis. The multi-G oligonucleotides are used to inhibit proliferation of smooth muscle cells, such as to prevent arterial restenosis. These sequences are not antisense sequences, but are thought to work in a similar way. The sequences are thought to act by binding to proteins involved in the proliferation process. Compounds contening these multi-G oligonucleotides are not toxic, and their effect on cell proliferation is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, telomerase reverse transcriptase, hTRT, TRT, diagnosis, prognosis,

describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT. by detecting the change in hTRT recombinant protein or polynuclectide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein properation of hTRT with a telomerase RNA component; (C) detection of the TRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of RNA detection, amplifying the product with presence of hTRT in the sample, or amplifying the product with presence of hTRT in the sample, and (D) increasing the proliferation of a vertebrate cell by increasing hTRT expression; and (E) the use of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits or ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is that of the target sequence #4 which was used in an experiment to determine the in vitro cleavage of target duplexes to evaluate the lengths of purine and pyrimidine tracts which are useful in obtaining oligonucleotides capable of triple helix formation with target nucleic acids. The complementary strand overhangs the 3' end by the sequence CTAG and the sense strand overhangs the complementary strand overhangs the complementary strand by
                                                                                                                                                                                                                                                                                                                           high telomerase activity. A

The strand runs 3' to 5' in an antiparallel orientation and when targeted to a specific sequence will deactivate it. This allows for growth inhibition in cancerous cells, manipulation of cellular structural protein content; inhibition of IL-2 chain receptor; disbursing plaque formation in Alzheimer's disease; inhibiting EGF gene; modulating cholestrol synthesis through the HMGCAA gene; suppressing NGF gene expression; arresting HSV-I replication and suppressing Beta-globin expression in thallassaemia and sicle cell anaemia patients. The APP770 gene is the precursor protein responsible for production of plaque in Alzheimer's disease. Expression of this gene may be prevented by the formation of a triplex between the duplex target DNA sequence and an anti parallel or parallel synthetic oligonucleotide. A suitable target sequence is that from base -434 to -407 of the APP770 gene and a suitable antiparallel synthetic oligonucleotide sequence is shown. See also AAQ36219-362. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The APP770 gene is the precursor protein responsible for production of plaque in Alzheimer's disease. Expression of this gene may be prevented by the formation of a triplex between the duplex target DNA sequence and an anti parallel or parallel synthetic oligonucleotide. A suitable target sequence is that from base -434 to -407 of the APP770 gene and a suitable parallel synthetic oligonucleotide sequence is shown. See also AAQ36219-362. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                The present sequence represents a primer from the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polymucleotide, on administration of the compound; (E) preparation of recombinant telomerase by contacting a protein or protein in a sample by binding a relevant probe to the sample hTRT RNA or protein in a sample by binding a relevant probe to the sample or mightlying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT captebrate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polymucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used to the name are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; telomerase reverse transcriptase; hTRT; TRT; diagnosis; prognosis; cell proliferation; cancer; ageing; ribonucleoprotein; primer; ss.
                                                                                     Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence represents a primer from the present invention which describes human telomerase transcriptase (hTRT). The present transcribes human telomerase reverse transcriptase (hTRT). The present transcribes human telomerase transcriptase (hTRT). The present transcriptase determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (C) preparation of recombinant telomerase by contacting a protein protein of preparation of hTRT with a telomerase By contacting a protein of the hTRT RNA or protein in a sample by binding a relevant probe to the sample of hTRT RNA or protein in a sample by binding a relevant probe to the sample complex formed or in the case of RNA detection, and detection the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT capperation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity and the new methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, telomerase reverse transcriptase, hTRT; TRT; diagnosis; prognosis; cell proliferation; cancer; ageing; ribonucleoprotein; primer; ss.
                                                                                                                                                                Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing.

                                                                                                                                                                                                     The present sequence represents a primer from the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase by contacting a protein protein in a sample by binding a relevant probe to the sample hTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) corrected in the use of an agent that causes an increase in cell expression; and (E) the use of an agent that causes an increase in cell expression; and (E) the use of an agent that that inhibits ageing. A protein preparation of effect of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used the constant of a protein preparation of the medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, telomerase reverse transcriptase, hTRT; TRT; diagnosis; prognosis; cell proliferation; cancer; ageing; ribonucleoprotein; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                 to treat conditions that are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new methods
                                                                                                                             Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing

the present sequence reverse transcriptase (hTRT). The present incepresent and escribes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polymucleotide, on administration of the compound; (B) preparation of hTRT with a telomerase BNA component; (C) detection of the TRT RNA or protein in a sample by binding a relevant probe to the sample of hTRT RNA or protein in a sample by binding a relevant probe to the sample of and etecting the complex formed or in the case of RNA detection, amplification product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) concreasing the proliferation of a vertebrate cell by increasing hTRT concreasing in the use of an agent that causes an increase in cell contract can be used in the manufacture of medicament that inhibit againg or cancer. Inhibitors of telomerase activity and the new methods activity. A protein preparation of hTRT can also be used in the new methods in the new methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present sequence represents a primer from the present invention which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Expression vector functional in eukaryotic protist, useful for expression of heterologous proteins, contains a coding sequence and regulatory flanking regions from a protist.
                                                                                                                                                                            The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ008152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Regulatory sequence; eukaryotic protist; telomere; alpha-tubulin; primer;
                                                                                                           New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.

This invention describes a novel expression vector (A) for eukaryotic protists comprises a sequence (I) encoding a protein and having, at its 3' and 5'-ends, native flanking regulatory sequences (RS) selected from Stylonychia lemnae and with terminal telomeric sequences. (A) are used for production of proteins in protists, particularly functional heterologous proteins. (A) provide overexpression of foreign proteins in protists, e.g. at 7.15 of total proteins. Bukaryotic protists can be protists, e.g. at 7.15 of total proteins. Bukaryotic protists can be grown simply and on a large scale to high cell density with short generation times and have metabolic and other properties similar to those of multicellular organisms (contrast prokaryotes). In the macronucleus genome of protists, most genes are amplified, resulting in high expression rates even under normal conditions. This sequence represents a primer used in the construction of the expression vector described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel expression vector (A) for eukaryotic prolists comprises a sequence (I) encoding a protein and having, at its 3 and 5' ends, native flanking regulatory sequences (RS) selected from Stylonychia lemmae and with terminal telomeric sequences. (A) are used for production of proteins in protists, particularly functional heterologous proteins. (A) provide overexpression of foreign proteins in protists, e.g. at 7-15% of total proteins. Eukaryotic protists can be grown simply and on a large scale to high cell density with short generation times and have metabolic and other properties similar to those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Expression vector functional in eukaryotic protist, useful for expression of heterologous proteins, contains a coding sequence and regulatory flanking regions from a protist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Identifying differentially methylated genomic CpG dinucleotide sequences associated with cancer, comprises measuring level of methylated genomic CpG dinucleotide sequences for genomic targets in sample and comparing to reference level.

Claim 28; SEQ ID NO 1411; 89pp; English.

The invention relates to a mehtod of identifying differentially methylated genomic CpG dinucleotide sequences associated with cancer, comprising measuring the level of methylated genomic CpG dinucleotide equences for two or more of the genomic targets in sample, and comparing the level of methylation at genomic CpG dinucleotide sequences in the sample to a reference level of methylated genomic CpG dinucleotide sequences. The method is useful for identifying differentially methylated genomic CpG dinucleotide sequences associated with cancer in an individual. The level of methylation of the differentially methylated genomic CpG dinucleotide sequences is used to diagnose cancer in the individual, predict the course of cancer, predict the susceptibility of cancer, stage the progression of cancer, predict the likelihood of overall survival, and predict the likelihood of recurrence of cancer for individual. The level of methylation of the differentially methylated genomic CpG dinucleotide sequences in the sample is also used to determine the effectiveness of a treatment course undergone by the individual. The cancer is preferably adenocarcinoma or squamous cell carcinoma. The probes are useful for detecting methylation of genomic CpG dinuclectide sequences of two or more genomic targets. The present sequence represents a CpG site probe.

Detecting an indicium of a disease in a heterogeneous biological sample comprises contacting the nucleic acid sample with an agent that modifies unmethylated cytosine, and detecting hypermethylated or hypomethylated nucleic acid.

Example 4; Page 17; Opp; English.

The invention relates to detecting an indicium of a disease in a heterogeneous biological sample. The method involves (a) isolating a comparison and calcacid sample comprising a CpG-containing target template from a nucleic acid sample comprised a CpG-containing target template from a heterogeneous biological sample; (b) contacting the nucleic acid sample with an agent that modifies unmethylated cytosine; (c) performing an amplification reaction on the target template using at least one chimeric primer that comprises a first portion that is not specific for the target template and a second portion, where the second portion is specific for the CpG-containing target template if the template comprises an unmodified cytosine at predetermined position, and (d) detecting the presence of an predetermined position, and indicium of a disease. The method is useful for detecting indicia of cancer in a biological sample, for detecting cancer detection in a homogenous sample, such as a biopsy sample. The method is especially suitable in clinical assays involving sporadic cancer detection, for infectious disease diagnostics, or inherited disease diagnostics. The new method makes it possible to detect a disease assaying of hypermethylation markers on genes pl4, HLTF, MINT31 and MINT2, used in detection of hypermethylation at multiple loci, which indicate a higher risk of colorectal cancer

cherecting 2 or more specialists attended to the interpretary chinase inhibitor has the following activities: antiaethmatic, respiratory equ., antinflammatory antirheumatic, antiarthritic, antiasculus activities: antiaethmatic, respiratory equ., and agastrointestinal-gen. The MLK family kinase inhibitor is useful for the treatment of asthma associated with a risk factor selected from at-risk haplotype for asthma, at-risk haplotype in MAPRY of gene, polymorphism in MAPRY midler activity and/or increased MLKI protein expression, dysregulation of MAPRY mRNA isoform, increased MLKI protein soform expression; and in diagnosis or identification of susceptibility to asthma. The inhibitor is also useful for the treatment of other respiratory diseases associated with MAPRY or other members of the JNK pathway such as chronic obstructive pulmonary disease, chronic bronchitis and other inflammatory diseases such as rheumatoid arthritis, polymorary diseases until inflammatory diseases. This production dequence represents a reverse primer which is used in amplifying a marker of the MAPRYS innase, where MAPRYS is a part of mitogen-Activated Protein Kinase (MAPK) signal transduction pathways, of

the invention.

Use of mixed lineage kinase family kinase inhibitor in the manufacture of a medicament for treatment of asthma associated at-risk haplotype for asthma, at-risk haplotype in MAP3K9 gene or increased MLK1 protein expression or activity.

WPI; 2005-122681/13.

Disclosure; Fig 12; 640pp; English.

The invention relates to the movel use of a mixed intase (wilk) the invention relates to the invention relates to the invention relates to the invention relates to the invention sethma, at-risk haplotype in MARIX9 gene, polymorphism in MARIX9 mixed acid, dysregulation of a MARIX9 gene, polymorphism in MARIX9 mixed acid, dysregulation of a MARIX9 gene, polymorphism in MARIX9 mixed acid, dysregulation of a MARIX9 gene, polymorphism in MARIX9 gene, polymorphism in MARIX9 gene, polymorphism in a sample, a method for the diagnosis or identification of molecule for diagnosing asthma or susceptibility to asthma in a sample, and the presence of a first nucleic acid molecule in a sample, amethod for assessing the response to treatment with an MIX family kinase nucleic acid inhibitor in a target population or in an ample, a method for assessing the response to treatment with an at-risk haplotype for asthma, at-risk haplotype in the MARIX9 gene, polymorphism in the MARIX9 mucleic acid, dysregulation of MARIX9 gene, polymorphism in the MARIX9 mixed acid, dysregulation of MARIX protein isoform expression, increased MIXI biochemical activity or increased MIXI protein isoform expression; a method for assessing the response to treatment with an MIXI inhibitor in a target population including an individual with an at-risk haplotype for asthma, as above; a kit for assaying a sample for the presence of at least one haplotype comprising 2 or more alleles associated with asthma comprising: at least one specific allele; a reagent kit for assaying the presence of at least one haplotype comprising 2 or more alleles associated we have a sees in the comprising 2 or more alleles associated we have a sees one apecific allele of detecting at least one specific allele of a reagent kit for assaying at least one haplotype comprising 2 or more alleles associated we have a sees one specific allele of detecting at least one specific alled nucleic acid capable of detecting at least one apecific alled a reagent kit least one specific alled a reage invention relates to the novel use of a mixed lineage kinase (MLK)

The invention relates to a novel quantitative method for adding linear polynucleotide to solution containing a cation. The linear polynucleotide contains telomere repeat sequence with donor at one edge portion and acceptor at another edge portion. The optical detection is performed using this linear polynucleotide. The method of the invention is useful in medical fields such as clinical laboratory test and fields with cation fixed assay. The present sequence is used in the exemplification of the
adding linear polynucleotide containing telomere repeat sequence wi
donor and acceptor at edge portions, to solution containing cation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                              The invention describes a method of detecting and/or differentiating between prostate cell proliferative disorders in a subject comprising contacting genomic DNA isolated from a biological sample with at least contacting genomic DNA isolated from a biological sample with at least cone reagent, or series of reagents that distinguishes between methylated cone reagent, or series of reagents that distinguishes between methylated cards e.g. HISTONE H4. Also described are: a treated mucleic acids e.g. HISTONE H4. Also described are: a treated concerts at leas one unmethylated cytosine base of the casponent converts at leas one unmethylated cytosine base of the genomic DNA sequence to uracil or another base that is detectable comprising at lest 16 contiguous nucleotides of a treated genomic DNA sequences complementary to them; an oligomer comprising a sequence of sequences complementary to them; an oligomer comprising a sequence of at least 9 contiguous nucleotides that is complementary to, or hybridizes under moderately stringent or stringent conditions to a treated genomic DNA sequence above; as et of oligomers comprising at least two coligomers above; and a kit useful for detecting and/or distinguishing between or among prostate cell proliferative disorder of a subject comprising a contiguous sequence at least or complementary to, or hybridizes complements or sequence complements. The concludes that is complementary to, or hybridizes under moderately stringent conditions to a sequence selected from SEQ ID NO: 60-295, 1029-1076, 1117-1120, 1172-1175 and their complements. The concludent capted caid, oligomer, set of oligomorlectibes that second molecule comprising a contiguous sequence at least or method or among cell candul for detecting and/or differentiating between or among cell contingent or stringent cardidoling a prostate cell proliferation a seculated from SEQ ID NO: confidential disorders. This sequence selected from SEQ ID NO: confidention of gene encoding a prostate cell proliferation associated a primer

```
The invention relates to a novel quantitative method for adding linear polynucleotide to solution containing a cation. The linear polynucleotide contains telomere repeat sequence with donor at one edge portion and acceptor at another edge portion. The optical detection is performed using this linear polynucleotide. The method of the invention is useful in medical fields such as clinical laboratory test and fields with cation fixed assay. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                      Quantitative method of cation for clinical laboratory test, involves adding linear polynucleotide containing telomere repeat sequence with donor and acceptor at edge portions, to solution containing cation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for predicting a disease, monitoring (rate of) progression of a disease, predicting therapeutic cutcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                           17, leukocyte, gene expression profiling, allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus; rheumatoid arthritis, osteoarthritis, cytomegalovirus; infection, probe,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Prentice J, Phillips
                                                                                                                                                                                  Human leukocyte gene expression profiling probe SEQ ID NO 1029

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich prich or thymidine (T) rich The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae) had to thomyvoritidae), bacterial antigens (e.g. toxoplasma, and/or orthomyxoritidae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Strand displacement amplification; primer; detection; probe; reporter; fluorescent donor; quencher dye; ss.
                                                                                                                                                                                                                                                                                                        Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae haemophilus, campylobacter, closcridium, Bscherichia coli and/or staphylococus), fungal antigens and/or parastitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or firm when deficiency. The present sequence can also be used to redirect a Thi to a Thi immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine, cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma; infectious disease; allergy; immune deficiency; phosphorothioate; ss.

This invention describes a novel signal primer (I) comprising a reporter probe (II) and an adapter oligonucleotide (III) hybridized to (II), such that (I) comprises intermolectularly base-paired portion and a single-catranded target binding sequence. (I) comprises (II), which in the absence of hybridization to a complementary sequence assumes a conformational structure which brings a fluorescent donor/quencher dye pair linked to it into sufficiently close spatial proximity to quench conformational structure which brings a fluorescent donor/quencher dye pair linked to it into sufficiently close spatial proximity to quench conformation into sufficiently close spatial proximity to quench conformation (I) such that (I) comprises an intermolectide (III) hybridized to conclet arget sequence: (I) by: (a) hybridizing with the target sequence such that formation of a secondary structure as an indication of secondary structure as an indication of the presence of the target sequence; or (2) by: (a) hybridizing (I) to the presence of the target sequence; or (2) by: (a) hybridizing (I) to the target sequence; or (2) by: (a) hybridizing (I) to the presence of the target sequence; or (2) by: (b) hybridized to a second oligonucleotide complementary to (I) which forms a secondary structure when not hybridized to a complementary sequence; (b) separating the second oligonucleotide complementary sequence (I) as an indication of the presence of target sequence. Detection of a variety of different targets is simplified as the adapter polynucleotide to the target, as a result the 5° adapter sequence may consider such that it is the same in a variety of oligonucleotide with different target binding sequences. A single colligonucleotide with different target binding sequences. A single colligonucleotide by the presence of the second oligonucleotide of or detection of a variety of inferent target sequence. A single colligonucleotide by the presence of the second oligonucleotide same in a variety of inference target sequences. A single c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anglogenesis inhibitor; ss; anglogenesis; solid tumour growth; tumour metastasis; precancercus lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial anglogenesis; blade neovascularisation; telangiectasia; heemophiliac joint; anglofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     less costly, to synthesize than reporter probes as they do not require labeling for use
Novel signal primer for detecting nucleic acid target sequences by fluorescence quenching mechanisms, comprising a reporter probe and an adaptor oligonucleotide hybridized to the probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
